Logistics Performance & Sales Analysis Report

Project objective

The main objective of this project is to build a scalable and interactive business intelligence solution that transforms raw logistics data into meaningful insights, focusing on financial performance, delivery efficiency, and customer trends to support strategic and operational decision-making.

Business problem/Opportunity

The rapid growth of logistics and supply chain operations has led to a significant increase in shipment volumes across regions, warehouses, and transportation modes. However, decision-makers often lack a unified and comprehensive view of key operational metrics, leading to inefficiencies and delayed decision-making.

Currently, there is limited visibility into:

- Shipment delivery performance and delay patterns
- Regional, warehouse, and carrier efficiency
- Cost optimization and profit margins across logistics operations
- Customer behavior and order fulfillment trends
- Increasing logistics operations make it difficult to track revenue, profit, and shipping cos**ts,**

- Lack of clear visibility into monthly performance trends
- Difficulty in identifying high and low performing product categories

This dashboard presents an opportunity to consolidate these insights into a single, interactive Power BI platform. By enabling real-time monitoring and data-driven analysis, it supports strategic decision-making, improves operational efficiency, reduces costs, and enhances overall supply chain performance.

Target Audience

- **Business Analysts** – For analyzing revenue, profit trends, and performance insights
- **Operations Team** – For monitoring shipment performance and delivery efficiency
- **Supply Chain Managers** – For optimizing logistics operations and cost control
- **Finance Team** – For tracking profit margins, revenue, and shipping costs
- **Executives / Management** – For overall business performance overview and strategic decision-making

Scope

Dashboard with four key analysis pages:

1) Executive Financial & Profitability Dashboard
2) Operational Efficiency & Delivery Performance Dashboard
3) Geographical Flow & Carrier Analysis Dashboard

4) Customer Experience & Quality Dashboard

Key KPIs and performance metrics

Data normalization in PostgreSQL

Data Sources(s)

Size

30.59 MB

Source

Operation department

Type

CSV

Key metrics/KPIs

- Total Profit
- Total Revenue
- Total Shipping Cost
- Profit Margin (%)
- Total orders count
- Total volume
- Total Weight

Deliverables

Choose dataset, load to power Bi and document business requirements

Assess dataset & clean data

Document functional requirements & create dashboard mockups

Build power BI dashboard & data model (draft)

Finalize dashboard & data model, export reports, prepare analysis Report & README

Timeline / Milestones (5-Day Plan)

Day	Task
Day 1	Dataset Understanding
Day 2	Cleaning, PostgreSQL Normalization & Table Creation
Day 3	Power BI Connection & DAX Measures
Day 4	Dashboard Design (pages 1-4)
Day 5	Final Touches

Notes / Assumptions

- The dataset is assumed to be cleaned and preprocess before analysis
- All financial values (Revenue, Profit, Cost) are in a consistent currency format
- The dashboard represents historical data for analysis purposes
- Calculations like Profit Margin (%) are derived using standard formulas
- Visualizations are designed for high-level business insights, not detailed transaction-level analysis
